

Why to Use Aerial Photography for Construction?

- Aerial photography provides you with a complete view of the construction site which you cannot see from the ground.

- When done monthly, aerial photography is invaluable for keeping up with the progress of your construction project. It provides helpful documentation in case of a legal dispute and can be used to supplement monthly progress reports and marketing materials.

- Construction progress photography makes it easier for you to manage your project and for your clients to see the big picture.

- From the first site survey to the final completed building, aerial photography records step-by-step the progress of your construction as we capture as many views of the site as necessary and edit them to match your needs.

- Any construction site, large or small, can be photographed, including apartment communities, shopping centers, drugstores, hotels, golf courses, restaurants, residential property, car dealerships, airports, schools, etc.
